

UNDERSTANDING CSS DISPLAY

While working with CSS, ever got confused about why some of the elements starts in a new line while some continues with the flow of text ?

It is because of the
display property

```
.element {  
  display: block/inline/  
           inline-block/none;  
}
```

4 important display
properties

Lets discuss flex,
grid seperately

Lets understand them with
the bus travel **analogy**

block

block is the selfish rude guy in the bus who takes the whole seat area and sends others to next seat

Block-level elements take up the full width of their container with line breaks before and after, and can have their height and width manually adjusted. eg: div

```
element {  
  display: block;  
}
```

takes full width

block

width and height can be adjusted

block

inline

inline is the nice guy who only takes the space he needs and let others sit next to him

Inline elements take up as little space as possible, flow horizontally, & can't have their width or height manually adjusted. eg: span

```
.element {  
  display: inline;  
}
```

takes only needed space but width and height cannot be adjusted

inline

inline

inline-block

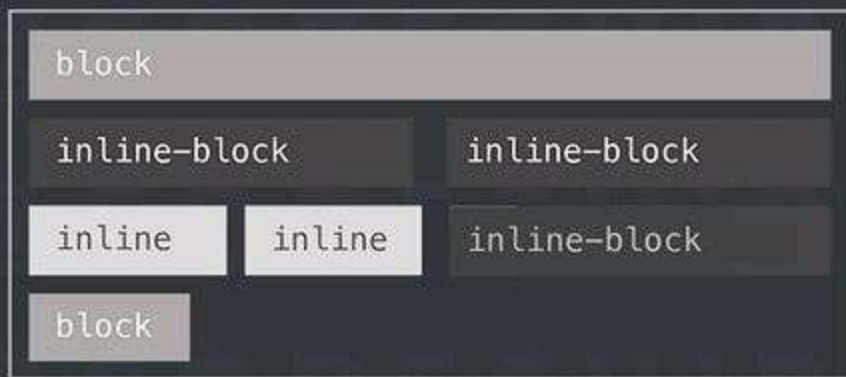

Sometimes you might have extra stuff and may require extra space. inline-block are those adaptable guys who adjust their spacing and let others sit next in the available space

Inline-block elements can appear next to each other, and can have their width and height manually adjusted.

None removes the
element from the view

✓ padding ✓ margin ✓ width

What did you say?

Officer, I said
I will go back!\$#
